

Auto Update installation

Before beginning the installation and configuration of Comarch ERP Standard system, it is necessary to properly install and configure Comarch ERP Auto Update program.

To do so, it is necessary to:

1. Download the installer file UpdateAgent_Setup_[version_no]_EN.exe
2. Run the installer
3. Accept the software terms and conditions of warranty and use
4. Select a setup folder for Comarch ERP Auto Update
5. Start the application

Note

The installer file UpdateAgent_Setup_[version_no]_EN.exe is available on the server <ftp1.support.comarch.pl> in the Pub directory in Comarch ERP Auto Update folder, as well as on individual websites dedicated to business partners.

Comarch ERP Auto Update preconfiguration

When Comarch ERP Auto Update is launched for the first time, the interface language selection window is opened. A language can be selected for the duration of a given program session or language selection can be remembered by the system permanently by selecting the parameter *Remember selection*. There are five supported languages available: Polish, English, German, French and Spanish (the language of the operating system is suggested by default).

Language selection

In the case of initial configuration of:

- **The parent agent** – it is necessary to leave the parameter *Connect this agent to Comarch server* selected and enter a client ID (provided by Comarch).

Parent agent preconfiguration window

- **A child agent** – it is necessary to deselect the parameter *Connect this agent to Comarch server* and enter a code of the agent previously added to the agent structure in the parent agent. Additionally, it is necessary to provide IP address of the main agent and port.

Child agent preconfiguration window

Completing preconfiguration will open Comarch ERP Auto Update application window and an attempt to connect to the Comarch server will be performed.

If the agent does not register with parent agent properly and the following message is displayed when attempting to establish connection: *“Agent has not registered with parent agent. The agent does not have the required permissions. The permissions must be granted from the level of the parent agent.”* It may mean that:

- the client ID given is incorrect
- the agent code has not been added to the parent agent or it has been deleted
- the entered address/name of the parent computer is invalid

Connection with a parent agent can also be blocked by system firewall/antivirus program.

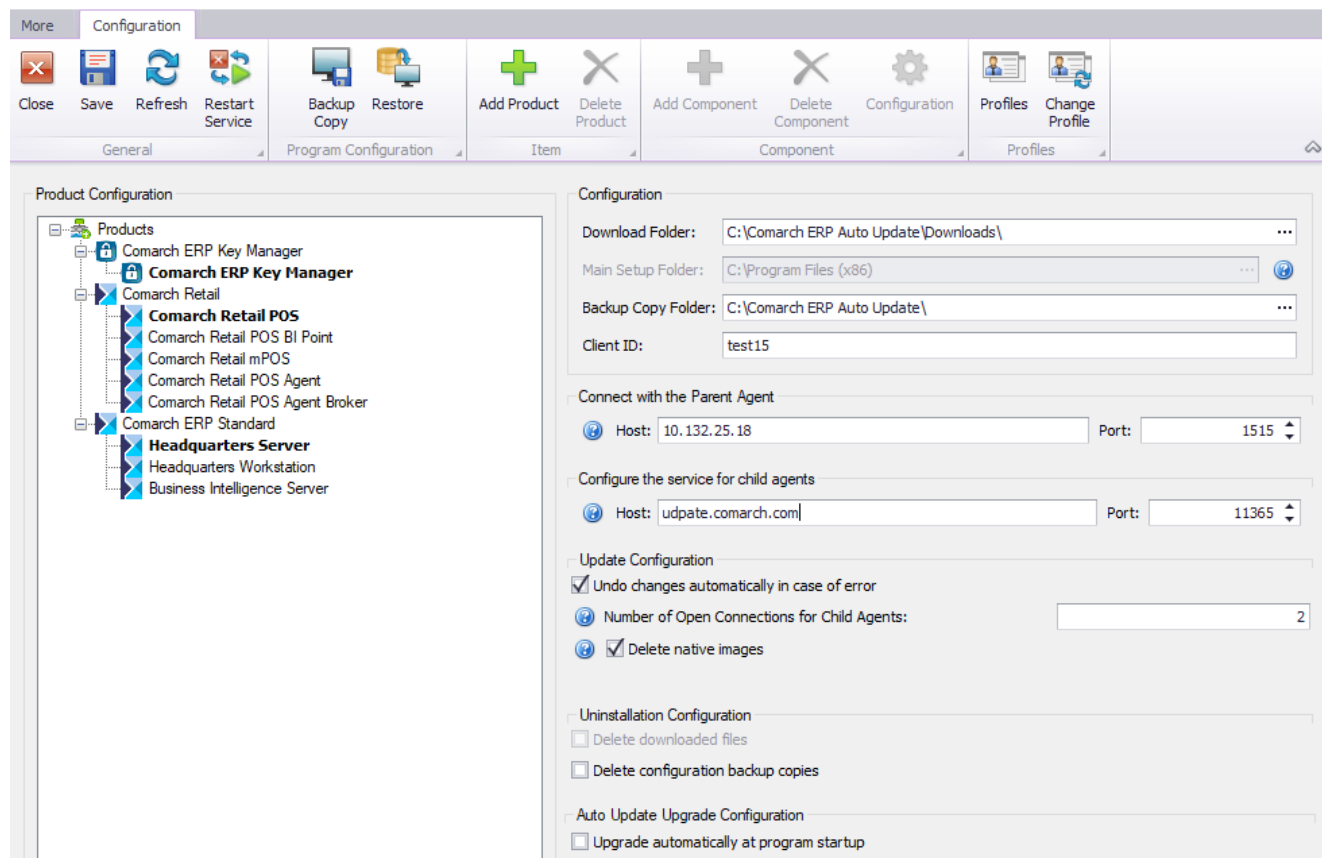

Parent agent configuration

In the agent structure, a parent agent always connects to Comarch server at the address *update.comarch.com* and the port 8466. In case there is no connection, that is when the message *Agent has not registered with parent agent* appears, it is necessary to check whether the entered client ID is correct and check the connection with Comarch servers.

Example

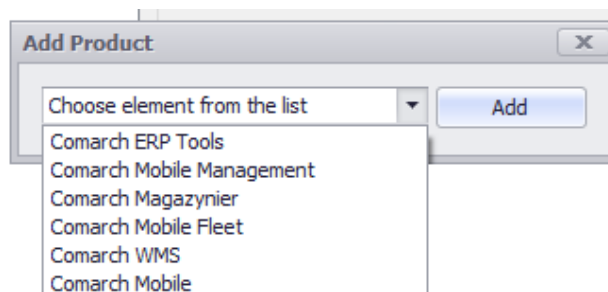

With the use of the telnet function, by entering, in the command line of cdm console:

telnet update.comarch.com 8466

Parent agent configuration window

In *Product Configuration* window, the user can specify which applications should be installed, by selecting a given product from the list.

Product selection

Next, it is necessary to select a component within that product. For example, for the main agent, for the Comarch ERP Standard product, it is possible to select [**Headquarters**

Server] component.

Component selection

The difference between the server component and the workstation component is that the following services are installed along with the server component:

- Comarch ERP BPM Server
- Comarch ERP Search service
- Comarch ERP Business Services
- Comarch Retail POS Data Service
